"Purification and characterization of a tetrachloro-p-hydroquinone reductive dehalogenase from a Flavobacterium sp.";
J. Bacteriol. 174:8003-8007(1992).
-!- FUNCTION: SEQUENTIAL REDUCTION OF TETRACHLORO-P-HYDROQUINONE TO MONOCHLOROPHENOL, USING GLUTATHIONE AS THE REDUCING AGENT.
-!- PATHANY: SECOND, THIRD AND FOURTH STEPS IN PENTACHLOROPHENOL (PCP)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               MEDLINE-93239690; PubMed-8478329;

"The complete genome sequence of the lactic acid bacterium Lactococcus lactis ssp. lactis ILI403."
Genome Res. 11:731-753(2001).
-!- FUNCTION: ENDOPEPTIDASE WITH BROAD SUBSTRATE SPECIFICITY FOR SEVERL OLIGOPEPTIDES. OPTIMUM ACTIVITY IS MEASURED AT PH 6.0-6.5 AND TEMPERATURES 30-38 DEGREES C.
-!- COFACTOR: BINDS 1 ZINC ION (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

Bacteriol. 183:4823-4838(2001).

-! CATALYTIC ACTIVITY: ATP + L-asparagine + tRNA(Asn) = AMP + diphosphate + L-asparaginyl-tRNA(Asn).

-! SUBGNIT: Homodime (By similarity).

-! SUBCLICUAR LOCATION: Cytoplasmic.

-! SIMILARITY: BELONGS TO CLASS-II AMINOACYL-TRNA SYNTHETASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PRINTS; PRO1042; TRNASYNTHASP.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     MICTOBIOLOGY 140:741-752(1994).

-I- FUNCTION: NECESSARY FOR EFFICIENT RNA POLYMERASE TRANSCRIPTION ELONGATION PAGE TEMPLATE-ENCODED ARRESTING SITES. THE ARRESTING SITES. THE ARRESTING SITES IN DNA HAVE THE PROPERTY OF TRAPPING SITES. THE ARRESTING OF ELONGATING RNA POLYMERASES THAT PASS THROUGH, RESULTION OF ELONGATING RNA POLYMERASES. CLEAVAGE OF THE NASCRET TRANSCRIPT BY CLEANAGE FACTORS SUCH AS GREA OR GREB ALLOWS THE RESUMPTION OF ELONGATION FROM THE NEW 3'TERMINUS. GREA RELEASES SEQUENCES OF 2 TO 3 NUCLECTIDES (BY SIMILARITY).

--- INDUCTION: BY HAAT SHOCK, SALT STRESS, OXIDATIVE STRESS, GLUCOSE LIMITATION AND DXYGEN LIMITATION.

                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               elongation past template-encoded arresting sites. The arresting sites in DNA have the property of trapping a certain fraction of elongating RNA polymerases that pass through, resulting in locked ternary complexes. Cleavage of the nascent transcript by cleavage factors such as greA or greB allows the resumption of elongation nucleotides (By similarity).

                                                                                                                                                                                                                                    DNA, followed by passage and rejoining.

-!- SUBDNIT: NONOMER (BY SIMILARITY).
-!- MISCELLANEOUS: WHEN A TOPOISOMERASE TRANSIENTLY BREAKS A DNA
BACKBONE BOND, IT SIMULTANEOUSLY FORMS A PROTEIN-DNA LINK, IN
WHICH A TYROSYL OXYGEN IN THE ENZYME IS JOINED TO A DNA PHOSPHORUS
AT ONE END OF THE ENZYME SEVERED DNA STRAND.
-!- SIMILARITY: BELONGS TO PROKARYOTIC TYPE I/III TOPOISOMERASE
                                                                                                                                                             "Complete sequence analysis of the genome of the bacterium Mycoplasma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                   Nucleic Acids Res. 24:4420-4449(1996).
--- FUNCTION: THE REACTION CATALYZED BY TOPOISOMERASES LEADS TO THE CONVERSION OF ONE TOPOLOGICAL ISOMER OF DNA TO ANOTHER.
--- CATALYTIC ACTIVITY: ATP-independent breakage of single-stranded
DNA topoisomerase I (EC 5.99.1.2) (Omega-protein) (Relaxing enzyme)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Isomerase; Topoisomerase; DNA-binding; Zinc-finger; Metal-binding;

1- POLYMORPHISM: THE POLY-GLN REGION OF SCA7 IS HIGHLY POLYMORPHIC (4 TO 18 REPEATS) IN THE NORMAL POPULATION AND IS EXPANDED TO ABOUT 38-130 REPEATS IN SCA7 PATIENTS. INTERMEDIATE ALLELES WITH 28 TO 35 REPEATS ARE PRONE TO FURTHER EXPANSION.

1- DISEASE: DEFECTS IN SCA7 ARE THE CAUSE OF SPINOCEREBELLAR ATAXIA TYPE 7; ALSO KNOWN AS AUTOSOMAL DOWINANY CEREBELLAR ATAXIA (ADCA-II). ADCA-II IS CHARACTERIZED BY PIGMENTARY MACULAR DYSTROPHY AND RETINAL DEGENERATION LEADING TO BLINDNESS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     TISSUE-Colon;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         FUNCTION: RNBSEP catalyzes the removal of the 5'-leader sequence from pre-tRNA to produce the mature 5'terminus. It can also cleave other RNA substrates such as 4.5s RNA. The protein component plays an auxiliary but essential role in vivo by binding to the 5'-leader sequence and broadening the substrate specificity of the ribozyme (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Bolotin A., Wincker P., Mauger S., Jaillon O., Malarme K., Weissenbach J., Ehrlich S.D., Sorokin A.; "The complete genome sequence of the lactic acid bacterium Lactococcus lactis ssp. lactis IL1403." Genome Res. 11:731-753(2001).
